(54) Title: FLAME RETARDANT CONPOSITIONS

(57) Abstract: Organic polymeric substrates, for example polyolefins such as polypropylene, can be made flame retardant by the incorporation of a synergistic mixture of (i) at least one low molecular weight sterically hindered alkoxyamine stabilizer, (ii) at least one high molecular weight sterically hindered alkoxyamine stabilizer and (iii) at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants. The compositions of the invention combine good flame retardant properties with light stability and good mechanical properties. The flame retardant (FR) market today is comprised of products which function to interfere with the combustion process by chemical and/or physical means. Mechanistically these FRs have been proposed to function during combustion of an article in either the gas phase, the condensed phase or both. The organohalogens are proposed to generate halogen species (e.g. HX) which interferes in the gas phase with free radical organic "fuel" from the polymer substrate. Synergists are proposed to react with HX to form additional chemical species which interfere with combustion in the gas phase, such as reaction of antimony oxide with HX to form antimony halide and water vapor. Antimony compounds such as antimony trioxide also act as a radical scavenger forming antimony halides. Thus, it can inhibit the propagation of the fire.

Although antimony compounds are efficient in terms of cost performance, it recently raised a lot of concern because of the toxicity of the byproducts which are formed during combustion in the presence of a halogenated flame retardant. Antimony oxides often contain trace amounts of arsenic compounds which are suspected carcinogens. Because of these ecological concerns, there is a motion to replace antimony trioxide in the present commercial flame retardant applications. However, it is very difficult to find an effective synergist which is both environmentally friendly and efficient as far as the cost performance is concerned.

Another reason to add flame retardant additives is to prevent dripping during the application of the fire. Dripping during combustion is the process of the separation of parts of the polymer from the matrix in the shape of droplets. Most often, the droplets are flaming and are imposing tremendous danger for fire spread. It is a common measure to add fillers such as talc in large amounts to the polymer, with some negative consequences on the mechanical properties. Fillers sometimes used include calcium carbonate, magnesium carbonate, zinc borate, silicates, silicones, glass fibres, glass bulbs, asbestos, kaolin, mica, barium sulfate, calcium sulfate, metal oxides, hydrates and hydroxides such as zinc oxide, magnesium hydroxide, alumina trihydrate, silica, calcium silicate and magnesium silicate.

It has been found that polymers with good flame retardant properties are prepared when a low molecular weight sterically hindered alkoxyamine and a high molecular weight sterically hindered alkoxyamine is added thereto together with a conventional flame retardant. Conventional flame retardants are for example organohalogen flame retardants. With this combination, antimony compounds and flame-retardant fillers or conventional fillers may be largely reduced or replaced. As the instant alkoxyamine compounds are active as stabilizers, the polymer compositions of the invention are efficiently protected from the deleterious effects of light, oxygen and/or heat.

### Detailed Disclosure

The instant invention pertains to a flame retardant composition which comprises

(A) an organic polymer substrate and

(B) an effective flame retarding amount of a synergistic mixture of

(i) at least one low molecular weight sterically hindered alkoxyamine stabilizer,

(ii) at least one high molecular weight sterically hindered alkoxyamine stabilizer and

(iii) at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants.

Advantageously, present composition contains only minor amounts of antimony compounds such as  $\text{Sb}_2\text{O}_3$ , e.g. less than about 1%, for instance less than about 0.1% by weight of the polymer component A; for example, the present compositions are essentially free of antimony.

Flame-retardant fillers are not required in order to improve the flame retardant properties and achieve a higher rating, e.g. in the UL-94 burning test (*infra*). Consequently, the compositions of the present invention may contain only minor amounts of flame-retardant fillers, e.g. less than about 3%, for instance less than about 1%, for example less than about 0.1% by weight of the polymer component A; for example, the present compositions are essentially free of flame-retardant fillers.

Flame-retardant fillers are known in the art and are selected from the group consisting of magnesium hydroxide, alumina trihydrate and zinc borate. Flame-retardant fillers are inorganic compounds employed for flame-retardant properties, and at high enough levels to be considered "filler".

If conventional fillers such as talc, calcium carbonate and the like are normally employed for instance for flow properties in order to reduce the spread of flaming droplets (not flame-retardant per se), such conventional fillers may also be reduced with the use of the present compositions. For instance, the present compositions may contain only minor amounts of conventional fillers, for example less than about 3%, for instance less than 1%, for example less than about 0.1% by weight of the polymer component A; for example, the present compositions are essentially free of conventional fillers.

Further, the present invention allows for conventional fillers to take the place of more expensive flame-retardant fillers.

The polymeric substrate of component (A) is any of a wide variety of polymeric types including polyolefins, polystyrenics, and PVC. For example, the polymer substrate may be selected from the group of resins consisting of the polyolefins, the thermoplastic olefins, styrenic polymers and copolymers, ABS and polymers which contain hetero atoms, double bonds or aromatic rings. Specific embodiments are where component (A) is polypropylene, polyethylene, thermoplastic olefin (TPO), ABS or high impact polystyrene.

For example, the polymer substrate is selected from the group of resins consisting of the polyolefins, the thermoplastic olefins, styrenic polymers and copolymers, and ABS.

Another embodiment of the present invention is where the polymer substrate is selected from the group consisting of polypropylene, polyethylene, thermoplastic olefin (TPO), ABS and high impact polystyrene.

For instance, the polymer substrate is polypropylene, polyethylene or thermoplastic olefin (TPO). Organic polymers of component A are for example thermoplastic polymers such as polyolefins like polyethylene, polypropylene or copolymers thereof. The thermoplastic polymer is for example polypropylene.

- b) catalytic polymerisation using a catalyst that normally contains one or more than one metal of groups IVb, Vb, VIb or VIII of the Periodic Table. These metals usually have one or more than one ligand, typically oxides, halides, alcoholates, esters, ethers, amines, alkyls, alkenyls and/or aryls that may be either  $\pi$ - or  $\sigma$ -coordinated. These metal complexes may be in the free form or fixed on substrates, typically on activated magnesium chloride, titanium(III) chloride, alumina or silicon oxide. These catalysts may be soluble or insoluble in the polymerisation medium. The catalysts can be used by themselves in the polymerisation or further activators may be used.

typically metal alkyls, metal hydrides, metal alkyl halides, metal alkyl oxides or metal alkyloxanes, said metals being elements of groups Ia, IIa and/or IIIa of the Periodic Table. The activators may be modified conveniently with further ester, ether, amine or silyl ether groups. These catalyst systems are usually termed Phillips, Standard Oil Indiana, Ziegler (-Natta), TNZ (DuPont), metallocene or single site catalysts (SSC).

#### **Conventional Flame Retardants of Component (iii)**

The halogenated flame retardants useful as component (iii) in compositions of present invention may be selected from organic aromatic halogenated compounds such as halogenated benzenes, biphenyls, phenols, ethers or esters thereof, bisphenols, diphenyloxides, aromatic carboxylic acids or polyacids, anhydrides, amides or imides thereof; organic cycloaliphatic or polycycloaliphatic halogenated compounds; and organic aliphatic halogenated compounds such as halogenated paraffins, oligo- or polymers, alkylphosphates or alkylisocyanurates. U.S. Patent Nos. 5,844,029 and 5,880,191 disclose the use of saturated hydrocarbon amine oxides towards the stabilization of thermoplastic resins. It is disclosed that the thermoplastic compositions may further contain a stabilizer or mixture of stabilizers selected from phenolic antioxidants, hindered amine light stabilizers, ultraviolet light absorbers, organic phosphorus compounds, alkaline metal salts of fatty acids and thiosynergists. The co-use of amine oxides with other stabilizers towards stabilizing polyolefins is not exemplified.

Specific examples of additives are phenolic antioxidants (item 1 of the list), further sterically hindered amines (item 2.6 of the list), light stabilizers of the benzotriazole and/or o-hydroxyphenyltriazine class (items 2.1 and 2.8 of the list), phosphites and phosphonites (item 4 of the list) and peroxide-destroying compounds (item 5.) of the list.

Additional specific examples of additives (stabilizers) which are benzofuran-2-ones, such as described, for example, in US-A-4,325,863, US-A-4,338,244 or US-A-5,175,312.

The instant composition can additionally contain another UV absorber selected from the group consisting of the s-triazines, the oxanilides, the hydroxybenzophenones, benzoates and the  $\alpha$ -cyanoacrylates. Particularly, the instant composition may additionally contain an effective stabilizing amount of at least one other 2-hydroxyphenyl-2H-benzotriazole; another tris-aryl-s-triazine; or hindered amine or mixtures thereof. For example, additional components are selected from pigments, dyes, plasticizers, antioxidants, thixotropic agents, levelling assistants, basic costabilizers, further light stabilizers like UV absorbers and/or sterically hindered amines, metal passivators, metal oxides, organophosphorus compounds, hydroxylamines, and mixtures thereof, especially pigments, phenolic antioxidants, calcium stearate, zinc stearate, UV absorbers of the 2-(2'-hydroxyphenyl)benzotriazole and 2-(2-Hydroxyphenyl)-1,3,5-triazine classes, and sterically hindered amines.

The additives of the invention and optional further components may be added to the polymer material individually or mixed with one another. If desired, the individual components can be mixed with one another before incorporation into the polymer for example by dry blending, compaction or in the melt. Subject of the invention therefore is also a flame retardant additive combination comprising

(i) at least one low molecular weight sterically hindered alkoxyamine stabilizer,

(ii) at least one high molecular weight sterically hindered alkoxyamine stabilizer and

(iii) at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants.

Conveniently, the additives of above components (i), (ii) and (iii) and possibly further additives as described above may be dry blended and then extruded, for instance in a twin screw extruder at 180-220°C, with or without nitrogen atmosphere. The material thus obtained may be further processed according to known methods. The surface of the articles formed do not show any loss of gloss or any kind of roughness.

A preferred polymer article comprises a thermoplastic polyolefin as polymer substrate; especially a thermoplastic polyolefin roofing membrane which comprises a pigment selected from titanium dioxide and carbon black.

Components (B) of specific technical importance are

- (i) bis(1-octyloxy-2,2,6,6-tetramethylpiperidin-4-yl) sebacate or  
1-(2-hydroxy-2-methylpropoxy)-4-octadecanoyloxy-2,2,6,6-tetramethylpiperidine

and

- (ii) the reaction product of 2,4-bis[(1-cyclohexyloxy-2,2,6,6-piperidin-4-yl)butylamino]-6-chloro-s-triazine with N,N'-bis(3-aminopropyl)ethylenediamine) or  
the compound of formula

in which n is from 1 to 15 and

- (iii) an organohalogen flame retardant, especially tris[3-bromo-2,2-bis(bromomethyl)propyl] phosphate.

A polymer article preferably containing these additives is a thermoplastic polyolefin roofing membrane which also comprises a pigment selected from titanium dioxide and carbon black.

Preferred molded polymer articles comprise at least one sterically hindered alkoxyamine stabilizer and at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants, wherein said article comprises no flame-retardant filler or a flame-retardant filler in an amount less than about 3% by weight based on the weight of the article. Especially preferred is a polymer article which is about 5 mil to about 100 mil thick (0.1 to 3 mm), and which comprises a pigment selected from titanium dioxide and carbon black, such as a construction article selected from the group consisting of roofing membranes, window profiles, siding and moldings. Preferred polymer substrate for these applications is a thermoplastic polyolefin.

Further, the instant invention pertains to a process for imparting light stability and flame retardancy to an organic polymeric substrate, which process comprises adding to said polymeric substrate an effective flame retarding amount of a synergistic mixture of

- (i) at least one low molecular weight sterically hindered alkoxyamine stabilizer,
- (ii) at least one high molecular weight sterically hindered alkoxyamine stabilizer and
- (iii) at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants.

The incorporation of the additives of the invention and optional further components into the polymer is carried out by known methods such as dry blending in the form of a powder, or wet mixing in the form of solutions, dispersions or suspensions for example in an inert solvent, water or oil. The additives of the invention and optional further additives may be

incorporated, for example, before or after molding or also by applying the dissolved or dispersed additive or additive mixture to the polymer material, with or without subsequent evaporation of the solvent or the suspension/dispersion agent. They may be added directly into the processing apparatus (e.g. extruders, internal mixers, etc), e.g. as a dry mixture or powder or as solution or dispersion or suspension or melt.

The incorporation can be carried out in any heatable container equipped with a stirrer, e.g. in a closed apparatus such as a kneader, mixer or stirred vessel. The incorporation is for example carried out in an extruder or in a kneader. It is immaterial whether processing takes place in an inert atmosphere or in the presence of oxygen.

The addition of the additive or additive blend to the polymer can be carried out in all customary mixing machines in which the polymer is melted and mixed with the additives. Suitable machines are known to those skilled in the art. They are predominantly mixers, kneaders and extruders.

The process is for instance carried out in an extruder by introducing the additive during processing.

Specific examples of suitable processing machines are single-screw extruders, contrarotating and corotating twin-screw extruders, planetary-gear extruders, ring extruders or cokneaders. It is also possible to use processing machines provided with at least one gas removal compartment to which a vacuum can be applied.

Suitable extruders and kneaders are described, for example, in *Handbuch der Kunststoffextrusion, Vol. 1 Grundlagen*, Editors F. Hensen, W. Knappe, H. Potente, 1989, pp. 3-7, ISBN:3-446-14339-4 (Vol. 2 *Extrusionsanlagen* 1986, ISBN 3-446-14329-7).

For example, the screw length is 1-60 screw diameters, for example 35-48 screw diameters. The rotational speed of the screw is for instance 10-600 rotations per minute (rpm), for example 25-300 rpm.

The maximum throughput is dependent on the screw diameter, the rotational speed and the driving force. The process of the present invention can also be carried out at a level lower than maximum throughput by varying the parameters mentioned or employing weighing machines delivering dosage amounts.

If a plurality of components are added, these can be premixed or added individually.

The additives of the invention and optional further additives can also be sprayed onto the polymer material. They are able to dilute other additives (for example the conventional additives indicated above) or their melts so that they can be sprayed also together with these additives onto the material. Addition by spraying during the deactivation of the polymerization catalysts is particularly advantageous; in this case, the steam evolved may be used for deactivation of the catalyst. In the case of spherically polymerized polyolefins it may, for example, be advantageous to apply the additives of the invention, optionally together with other additives, by spraying.

The additives of the invention and optional further additives can also be added to the polymer in the form of a masterbatch ("concentrate") which contains the components in a concentration of, for example, about 1% to about 40%, for example about 2% to about 20 % by weight incorporated in a polymer. The polymer must not be necessarily of identical structure than the polymer where the additives are added finally. In such operations, the polymer can be used in the form of powder, granules, solutions, suspensions or in the form of latices.

Incorporation can take place prior to or during the shaping operation. The materials containing the additives of the invention described herein are for example used for the production of molded articles, for example rotomolded articles, injection molded articles, profiles and the like. Thus, a molded polymer article made flame retardant by the incorporation of

(i) at least one low molecular weight sterically hindered alkoxyamine stabilizer,

(ii) at least one high molecular weight sterically hindered alkoxyamine stabilizer and

(iii) at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants

is another object of the invention.

It is also contemplated that PTFE, polytetrafluoroethylene (for example Teflon® 6C; E. I. Du Pont), may be advantageously added to the present compositions as an additional flame retardant, as disclosed in U.S. application 60/312,517, filed Aug. 15, 2001.

It has further unexpectedly been observed that polymer molded articles, which normally comprise large amounts of flame-retardant filler in order to maintain flame retardant properties, may be stabilized against light, heat and oxygen and made flame retardant, by the incorporation therein of a present hindered alkoxyamine selected from present components (i) or (ii), in combination with a conventional organohalogen, phosphorus containing or melamine based flame retardant, and the amount of flame-retardant filler necessary is greatly reduced or even totally eliminated. The polymer molded articles are for example polyolefin molded articles, for example thin-section articles. The flame-retardant filler is typically magnesium hydroxide.

The thin-section polyolefin molded articles advantageously comprise present components (i), (ii) and (iii). The polyolefin molded articles of this invention, with reduced levels of flame-retardant filler or no flame-retardant filler, maintain flame retardancy and have improved physical properties.

The polyolefin molded articles of this invention may be used for example as roofing membranes, siding, window profiles and moldings. Such molded articles are for example about 5 mil to about 100 mil thick (0.1 to 3 mm), for example about 20 mil to about 100 mil (0.5 to 3 mm) thick, for instance about 10 mil to about 80 mil (0.1 to 2 mm), for example about 40 mil to about 100 mil thick (1 – 3 mm). The polyolefin is in particular thermoplastic polyolefin (TPO). The molded articles of this invention exhibit better physical properties than the state of

the art formulations, as exhibited by mechanical properties such as tensile strength, elongation resistance and crack resistance.

The effective flame retarding amount of component (B) is that needed to show flame retarding efficacy as measured by one of the standard methods used to assess flame retardancy. These include the NFPA 701 Standard Methods of Fire Tests for Flame-Resistant Textiles and Films, 1989 and 1996 editions; the UL 94 Test for Flammability of Plastic Materials for Parts in Devices and Appliances, 5th Edition, October 29, 1996; Limiting Oxygen Index (LOI), ASTM D-2863; and Cone Calorimetry, ASTM E-1354. Ratings according to the UL 94 V test are as compiled in the following table:

Rating	Afterflame time	Burning drips	Burn to Clamp
V-0	< 10 s	no	no
V-1	< 30 s	no	no
V-2	< 30 s	yes	no
Fail	< 30 s		yes
Fail	> 30 s		no

rpm) equipped with a corresponding nozzle (sample dimension 2mm thickness, 10 cm width).

Weathering: Punched samples are exposed to accelerated weathering (Atlas® WOM Ci 65, 0.35W/m<sup>2</sup> (at 340nm), 102 min dry, 18 min water spray, 63°C black panel temperature. The effect of weathering on the surface is assessed in the following manner:  
Visual inspection of chalking (chalking indicates decomposition on the surface).  
Gloss: Minolta; degradation of surface reduces the reflection of polarized light (60° gloss as defined in DIN 67530).

(54) Title: FLAME RETARDANT COMPOSITIONS

(57) Abstract: Organic polymeric substrates, for example polyolefins such as polypropylene, can be made flame retardant by the incorporation of a synergistic mixture of (i) at least one low molecular weight sterically hindered alkoxyamine stabilizer, (ii) at least one high molecular weight sterically hindered alkoxyamine stabilizer and (iii) at least one conventional flame retardant selected from the group consisting of the organohalogen, phosphorus containing and melamine based flame retardants. The compositions of the invention combine good flame retardant properties with light stability and good mechanical properties. Polyolefin molded articles are stabilized against light, heat and oxygen and made flame retardant with the incorporation of at least one sterically hindered alkoxyamine and at least one conventional flame retardant, while allowing normally high levels of flame-retardant fillers to be greatly reduced or eliminated.
